AI & ML INTERNSHIP

Task 1: Understanding Dataset & Data Types

Tools:

- Python(Pandas, NumPy)

Dataset:

- "AnyStandard CSV/Excel Dataset"

Hints / Mini Guide:

1. Load the dataset using Pandas.
2. Identify Numerical vs Categorical variables.
3. Use .info() and .describe() to understand data structure.
4. Check for missing values in the dataset.
5. Identify unique values in categorical columns.
6. Understand the shape and dimensions of the data.
7. Document the data types (int, float, object).

Deliverables:

- Jupyter Notebook (.ipynb) or Python Script
- Brief summary of the data structure

Final Outcome:

Intern builds a strong foundation in exploratory data analysis.

Interview Questions Related To Above Task:

- What is the difference between structured and unstructured data?
- Explain Numerical vs Categorical data types.
- What are continuous and discrete variables?
- How do you handle missing values in a dataset?
- What does the .describe() function tell you?

Submission Guidelines

- **Time Window:**

You can complete the task any time between 10:00AM to 10:00PM on the given day. Submission closes at 10:00 PM.

- **Self-Research Allowed:**

You are free to explore, Google, or refer to tutorials to understand concepts and complete the task effectively.

- **Debug Yourself:**

Try to solve all errors by yourself. This helps you learn problem-solving and ensures you don't face the same issues in future tasks.

- **No Paid Tools:**

If the task involves any paid software/tools, do not purchase anything. Just learn the process or find free alternatives.

- **GitHub Submission:**

Create a new GitHub repository for each task. Add everything you used for the task - code, datasets, screenshots (if any), and a short README.md explaining what you did.

- **Submit Here:**

After completing the task, paste your GitHub repo link and submit it using the link below:
